

Assumptions made by IT Department:

- Although TalentLMS is an enterprise application critical to core business operations, we are assuming that the user needing support with the application does not have to complete the required training immediately or by the end of the day. This is something the IT department should request more information on and escalate accordingly. We are also assuming they do not have issues logging into their account.
- For TravelPerk, we are assuming that the team member is not scheduled to travel very soon and is not a manager requiring access to provide approval for a team member who requires travel very soon.
- The organization has not yet been affected by an outage, nor have multiple affected users been reported.

1. You can only handle three tickets today. Which three do you choose and why? What do you communicate to the rest of the users?

- a. Three tickets to choose today:
 - i. User accidentally clicked on a link from an unverified sender - This ticket has extreme potential consequences/threats to the user's data, organizational data, and organizational security.
 - ii. User is locked out of Google Workspace - This ticket prevents the employee from accessing enterprise systems such as email, calendar, files, and more, resulting in downtime and inability to complete core work.
 - iii. User's laptop is running slow - This ticket is resulting in the team member's reduction in productivity and could indicate a deeper underlying issue such as software, hardware, storage, or a related problem.
- b. Three tickets to handle at a further date and communication response:
 - i. User needs support with TalentLMS - Thank you for reporting an issue with TalentLMS. Please send me more details on the issue you are facing, and a screenshot of any error messages so I can investigate further when I begin working on this ticket in the next 2-3 business days.
 - ii. User needs access to TravelPerk - Thank you for submitting this ticket to get access to TravelPerk. Please let me know if you have any travel to schedule within the next week, or if you are a manager requiring access to approve a team member's request. Once you provide me with these details, I can reassess and escalate based on urgency.
 - iii. User not receiving desktop/web app notification for Slack in real-time but they are receiving the updates on their mobile device - Thank you for letting us know about the issue with your Slack notifications. Since they

are still showing on your mobile device, please continue with this workaround, and I will inform you of any desktop and browser settings to check or change in the next few business days.

2. Please complete the following for each ticket:

a. User accidentally clicked on a link from an unverified sender

- i. Emergency - I assigned this emergency priority, as unverified links can be threats targeting the user or organizational data for ransom, unauthorized account access, or other motives. The impact of solving this ticket quickly reduces the risk to BEAM's systems and data.
- ii. Thank you for reporting this right away. Please do not interact with the link any further, and let me know if you entered any passwords or downloaded any files. Please disconnect your device from the network by taking out the Ethernet cable and disconnecting from the wifi. I'm escalating this ticket for immediate review and will provide further information soon.
- iii. Next steps:
 1. Ask what the user did after clicking the link, including entering any passwords, logging into any accounts, downloading files, etc.
 2. Document and preserve information such as the email, URL, what the user did afterwards, password breaches, and the outcome of the threat.
 3. Perform a security scan and monitor endpoints
 4. I balanced urgency by responding with immediate steps the user should take and to keep an open line of communication. Since this is a complex ticket, I mentioned that this would be escalated to the manager for further review. The communication tone was serious yet clear with specific instructions.
- iv. Flag and escalate

b. User is locked out of Google Workspace

- i. Urgent - I assigned this as urgent because this is an enterprise application; it's a core system for members to complete their work. The lockout would prevent them from completing the work, so resolving this ticket is urgent and should be completed as soon as possible.
- ii. Thank you for letting me know you are locked out, and I understand this may be affecting your ability to complete your work. I'll verify your identity and review the account. If you've received any error messages, please send me a screenshot so I can quickly support your issue.
- iii. Next Steps:
 1. Verify user identity by using an MFA method.

2. Ask the user for any error messages to pinpoint potential problems and mitigate downtime.
 3. Confirm whether the user account is suspended or blocked, and restore access using a password reset if necessary.
 4. Confirm the user can sign in and access Google Workspace systems before closing the ticket.
 5. I balanced urgency, complexity, and communication by assuring the user that I understand it affects their work and that by sharing any further details they have, we can resolve the issue quicker. There is a clear line of communication with the user on next steps and how they can contribute, while keeping a calm and empathetic tone.
- iv. Only escalate if there are signs of repeated lockouts, multiple users have lockouts, or there is unusual unauthorized access.
- c. User's laptop is running slow
- i. Normal - Although this issue reduces productivity, it does not immediately signify any major security incidents or inability to complete core work. However, it's still an issue that should be addressed quickly to avoid user frustration and to identify underlying device issues.
 - ii. Thank you for letting me know your laptop is running slow. I can understand this affects your ability to complete your work on time, so please inform me when this issue began, if it's affecting all applications, and if you have recently installed any new software. I will also review the device and help identify next steps to resolve the issue.
 - iii. Next Steps:
 1. Check basic device health, including storage, CPU usage, operating system updates, and network speeds.
 2. Run a security scan to detect any potential malware slowing down the laptop.
 3. Document findings, including any issues, and escalate if there is malware or it requires fixing/replacing.
 4. I balanced urgency and complexity by requesting information in my initial communication and asking direct questions that were easy for the user to answer, thereby reducing complexity. This allows the communication style to be clear and allows the user to understand that it will be handled soon.
 - iv. Not necessary to escalate unless underlying malware is detected upon further investigation.
- d. User needs support with TalentLMS

- i. Normal - This is a routine support ticket, not affecting the user's ability to complete their work or resulting in organizational downtime. The impact of solving this ticket depends on whether the user requires time sensitive trainings to complete.
 - ii. Thank you for reporting an issue with TalentLMS. Please send me more details on the issue you are facing, and a screenshot of any error messages so I can investigate further when I begin working on this ticket in the next 2-3 business days.
 - iii. Next Steps:
 - 1. Ask the user which course or page they need support with.
 - 2. Try basic troubleshooting solutions such as logging in and out, opening in a private window, or using a different browser.
 - 3. Balanced urgency and complexity by informing the user to give as much detail as possible prior to starting the ticket. This reduces the complexity for IT to troubleshoot while letting the user know the timeline for the ticket.
 - iv. No need to escalate.
- e. User needs access to TravelPerk
 - i. Normal - This is also a routine support ticket, not affecting core business work. The impact of this ticket is minimal as it does not affect multiple users or the organization.
 - ii. Thank you for submitting this ticket to get access to TravelPerk. Please let me know if you have any travel to schedule within the next week, or if you are a manager requiring access to approve a team member's request. Once you provide me with these details, I can reassess and escalate based on urgency.
 - iii. Next steps:
 - 1. Confirm what level of access they need: general user vs managerial access.
 - 2. Create the account and assign proper least privilege permissions.
 - 3. Follow up with the user to check if they have access to their account.
 - 4. Balanced urgency by letting the user know that the ticket timeline would be dependent on travel deadlines and reducing the complexity by asking if they are a base user or manager. The communication style is clear and concise.
 - iv. No need to escalate.
- f. User not receiving desktop/web app notification for Slack in real-time but they are receiving the updates on their mobile device

- i. Low - This ticket does not result in stoppage of work, nor does it cause user downtime. Hence, the impact of solving this ticket is minimal as it does not negatively affect the user.
- ii. Thank you for letting us know about the issue with your Slack notifications. Since they are still showing on your mobile device, please continue with this workaround, and I will inform you of any desktop and browser settings to check or change in the next few business days.
- iii. Next steps:
 - 1. Check notification settings on the desktop app and pop up notifications on the web app.
 - 2. After changing relevant settings, send a test message to ensure notifications are working properly.
 - 3. Balanced urgency, complexity, and communication by letting them know the next expected update and a quick solution/workaround, which informs them that the ticket is not so urgent, but they will be supported regardless.
- iv. No need to escalate.
